

Wazuh Agent and Endpoint Setup

Adding your first endpoint is where the fun actually begins, as your SIEM will finally start ingesting real security data!

The absolute easiest way to deploy an agent is by using the built-in deployment wizard right inside the Wazuh Dashboard. It automatically generates a custom installation script tailored to your specific OS and architecture.

Step 1. Open the Deployment Wizard

1. In your Wazuh Dashboard, click on **Wazuh** in the main menu to go to the overview screen.
2. Click on the **Agents** tab.
3. Click the blue **Deploy new agent** button.

2. Configure the Installer

The wizard will ask you a few simple questions to build your script:

- **Operating System:** Select **Your OS (MacOS in this case)**.
- **Architecture:** Select **Apple Silicon** if your Mac has an M1/M2/M3 chip, or **Intel** if it is an older model.
- **Wazuh server address:** Enter your Manager's IP address: <your_ip>
- **Agent group:** Leave this as default.

3. Run the Command on Your Endpoint

The wizard will generate a specific curl command at the bottom of the screen.

1. Open the **Terminal** app on your MacBook.
2. Paste the generated command and hit Enter. *(It will download the lightweight agent package and configure it to point to your IP).*
3. It may prompt you for your MacBook's administrator password to install the package.

4. Start the Agent Service

Once the installation finishes, you need to turn the agent on. The wizard will provide a second command to start the service, which usually looks like this:

```
Bash  
sudo /Library/Ossec/bin/wazuh-control start
```

Paste that into your Terminal and press Enter.

5. Verify the Connection

Go back to your Wazuh Dashboard and click **Close** on the deployment wizard. It may take about 30 to 60 seconds, but your MacBook will suddenly appear in the **Agents** list with a green "Active" status.

At that point, your MacBook is actively shipping its system logs, authentication events, and security metrics directly to your OpenSearch database!
